

S3 Sync Handoff

Taking over portfolio web updates while Alex is away

Prerequisites

Before starting, confirm both of these work on your Mac:

1. **Box Sync** — you see the portfolio-master folder

```
ls ~/Library/CloudStorage/Box-Box/Clients/BGE/portfolio-master
```

You should see a list of client folders (BGE, Delmarva, etc.).

2. **AWS SSO** — you can access the S3 bucket

```
aws sts get-caller-identity --profile sso-profile
```

You should see your name and account **103457025906**. If this fails, ask Alex to have IT add you.

Setup (one time — 2 minutes)

1. Clone the project to your Desktop

```
cd ~/Desktop
git clone https://github.com/Alexthebrit/icf-portfolio-source.git "ICF Portfolio App/v0.5.3"
```

Note: The clone is read-only. The sync pipeline is **Box** → **S3** — your local copy of the scripts never sends anything to GitHub. Nothing from your Desktop gets pushed unless you explicitly `git push`.

2. Install the auto-refresh LaunchAgent

```
cd "ICF Portfolio App/v0.5.3"
bash scripts/install-aws-autorefresh.sh
```

The LaunchAgent keeps your SSO session valid by re-authenticating every 6 hours (before the 8-hour expiry kicks in). When it opens a browser tab, just click **Allow** — that's it.

To confirm it's running:

```
launchctl list com.icf.aws-sso-refresh
```

How to sync (whenever you want)

```
bash ~/Desktop/"ICF Portfolio App/v0.5.3"/scripts/sync-to-s3.sh
```

It will:

1. Check your AWS credentials (opens a browser if expired — click Allow, wait a few seconds)
2. Sync the portfolio-master folder to the S3 web bucket
3. Show **"Sync complete — web version updated"** when done

That's the complete replacement for Cyberduck.

Running Server mode (for auto-syncs)

The auto-syncs only happen when the Electron app's **Build server** is toggled on. Here's how:

1. Open the **ICF Creative Portfolio** app from your Applications folder
2. Go to the **Server** tab
3. Click the **Build server** toggle to turn it on (it will auto-discover your Box folder)
4. Leave the app running in the background — that's it

The app will now watch for file changes and sync to S3 automatically. You can close the window, just don't **Quit** the app.

If another machine is already running the server, the app will ask if you want to take over. Click **Yes** — their lock will expire and your machine takes over.

Note: The server can only run on one machine at a time. The lock file prevents conflicts.

How often the web version updates automatically

While Server mode is running with the toggle on:

- **fswatch** detects file changes in Box → builds → syncs to S3 (every ~60s during active work)
- **Heartbeat** every 3 minutes as a safety net (builds even if nothing changed)
- Each successful build immediately syncs to S3

The website is always at most ~3 minutes stale while Server mode is on.

If Server mode is off, just run the manual sync command above.

Troubleshooting

Problem	Fix
aws: command not found	Run: <code>brew install awscli</code>
Operation not permitted	Run the install script again: <code>bash scripts/install-aws-autorefresh.sh</code>
Login timed out	Run manually: <code>aws sso login --profile sso-profile</code> , then retry sync
portfolio-master not found	Check Box is synced: <code>ls ~/Library/CloudStorage/Box-Box/Clients/BGE/portfolio-master</code>

After Alex returns

No cleanup needed. The LaunchAgent can stay — it only opens a browser when credentials are within 90 minutes of expiry, so most runs are silent. To remove it:

```
launchctl unload ~/Library/LaunchAgents/com.icf.aws-sso-refresh.plist
```

```
rm ~/Library/LaunchAgents/com.icf.aws-sso-refresh.plist
```
